06 · RELATIVE TO A PLAIN 60/40

Factor and risk monitor

07 · 100/0 · 100% VT · AS OF SEPTEMBER 16, 2026

Trailing returns vs benchmark

Annualized total return over the trailing 1-, 3-, and 5-year windows. The benchmark is a constant-weight mix of Vanguard Total World Stock (VT) and Vanguard Total World Bond (BNDW) at this policy's core equity/fixed split (100/0 · 100% VT). The policy line is a look-through reconstruction from sleeve roles, not live fund NAVs.

The benchmark is the core mix only. A satellite overlay is the usual source of tracking difference versus VT/BNDW.

11 · WHAT THIS MIX IS BUILT TO DO

Portfolio overview

- This is a 100/0 all equity core with a 20% satellite overlay. The policy is built for a growth risk budget - growth is the job of the core; the satellite is a deliberate, sized expression around it.
- The core is almost entirely equities. That is a feature, not an accident - this mix is designed to compound business earnings over a long horizon, with only a thin (or zero) bond sleeve as ballast.

PORTFOLIO OVERVIEW · CONTINUED

- The equity sleeve leans into growth and quality compounders, with a supporting value book so the policy is not a pure momentum trade. That mix is how Falcon keeps a growth orientation without abandoning price discipline.
- International and emerging-market equities are about 22% of the account. That is a second engine - the United States can lead for a long time, and this mix still refuses to make the household a single-country bet.
- The Artificial Intelligence sleeve (10%) is a themed bet on power, chips, and AI factory infrastructure. It will look brilliant in adoption years and expensive in the dull ones - size is how you stay in the game.
- Crypto (10%) is a 60/30/10 mix of Bitcoin, Ethereum, and Solana ETPs. Treat it as a convex satellite, not a savings account: path volatility will dominate tracking error, and that is the bargain.
- Look-through yield is about 1.52% and the weighted expense ratio is 0.25%. Yield is the cash the holdings are designed to produce, not a guaranteed coupon; the ER is what you pay each year to own the implementation.
- Estimated volatility near 18.8% and a stylized max drawdown around 36% are the price of this mix. A sharp year is not a broken policy - it is the tuition for a growth risk budget. Beta versus the S&P 500 is 1.03, so equity markets will still set the weather.
- Implementation is almost entirely daily-liquid ETFs, so rebalancing and cash raises are operationally simple. That is an underrated advantage when the household needs to act.
- The case for this mix is time: staying invested through a full market cycle so compounding has a chance to work. It is a policy to own, not a trade to time.

12 · IN THE MANNER OF STANLEY DRUCKENMILLER

A voice from the archives**Stanley Druckenmiller**

Quantum, Duquesne · Macro · convex bets, sized so you can be wrong

"When the payoff is convex, you don't need to be a zealot - you need a position you can hold through humiliation. A measured Bitcoin-led sleeve is a call option on a monetary regime the bond market still pretends is normal. Size it so a 70% drawdown is a bruise, not a funeral, and let the rest of the book do the boring compounding."

A crypto satellite is an asymmetric macro expression - the discipline is in the size, not the slogan.

*Hypothetical commentary written in the style of Stanley Druckenmiller for illustration and education. It is not a real quote, endorsement, affiliation, or recommendation by Stanley Druckenmiller or any firm associated with that name.

Model diagnostics as of the Falcon Core Model dated August 1, 2026. Figures are representative look-through characteristics, not live market data, NAV, or a performance composite.
